

SMILE ADVANCED LASER EYE TREATMENT

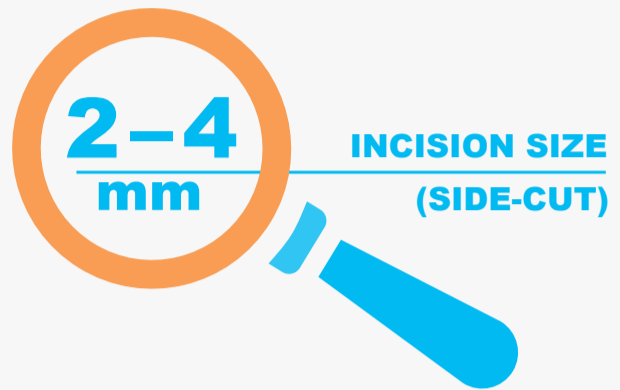

4 REASONS WHY YOUR EYES WILL LOVE SMILE

SMILE (small incision lenticule extraction) is an advanced technique and therefore the latest development in the refractive laser treatments. Beyond PRK and LASIK, this method is used to treat short-sightedness and astigmatism. The procedure is precise, virtually pain-free and an interesting option also for people with an active lifestyle.

1

MINIMALLY INVASIVE

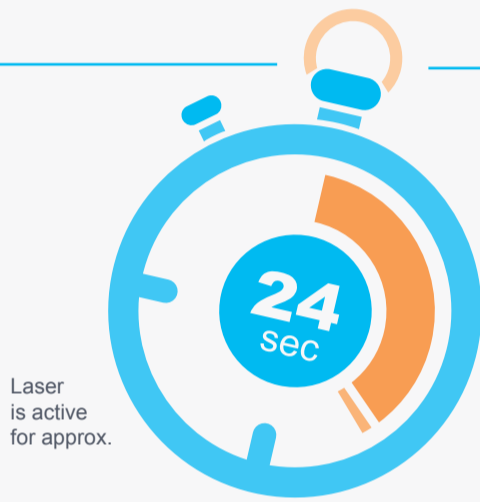

SMILE requires only a small incision. This gentle procedure means: Low infection and no flap detachment.

2

MAXIMUM COMFORT

SMILE supports a stress-free and comfortable treatment experience, which only takes a few minutes.

ZERO ODOR & NOISE

3

GENERALLY FAST HEALING

With SMILE, full visual recovery can normally occur within just a few days following your surgery.

RETURN TO WORK

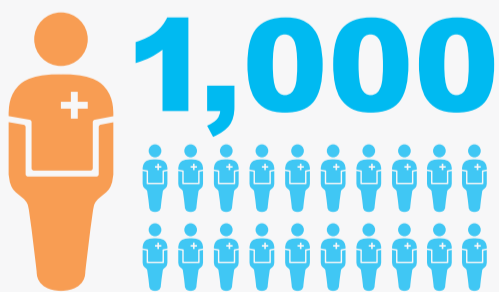

SHOWERING, APPLYING MAKEUP,
DOING SPORTS, DRIVING AND
OTHER DAILY ACTIVITIES

4

RELIABLE PRECISION

SMILE has proven predominantly excellent outcomes with a high degree of predictability.

MORE THAN 1,000 DOCTORS
WORLDWIDE PRACTICE SMILE.

1,000,000

EYES HAVE BEEN TREATED
SUCCESSFULLY WITH SMILE.

What is special about
ReLEx® SMILE? It was
developed by ZEISS.

- ZEISS developed the unique and innovative SMILE procedure
- A highly precise femtosecond laser system is used made by ZEISS
- ZEISS is known for precision and expertise in optics for more than 170 years
